a Recall relative to the long-read calls
n = 30 to 33 strains per point; mean with bootstrap interval over strains; dashes at 10x: three seeds
dashed line: identical sequence (exploratory)
fraction of long-read calls intact and called
realised depth (x), median over strains
SPAdes
MEGAHIT
b CDEII agreement among intact calls
n = 5 to 33 strains per point; mean with bootstrap interval over strains; dashes at 10x: three seeds
fraction with the long-read CDEII length
realised depth (x), median over strains
c Contiguity, on the axis of arm 1
n = 455 assemblies; unit: assembly
contig N50 (bp)
realised depth (x)
d Breaks at centromeres against AT-matched windows, seed 11; n = 30 to 33 strains per point; bootstrap interval over strains
no difference
break-rate ratio, centromere over null
realised depth (x), median over strains
